**ILI8961** 

#### 1. Introduction

ILI8961 is one-chip solution for TFT-LCD panel. This chip integrates source driver, gate driver, built-in power regulator and timing controller for the small panel application focused on the resolution of 960x240.

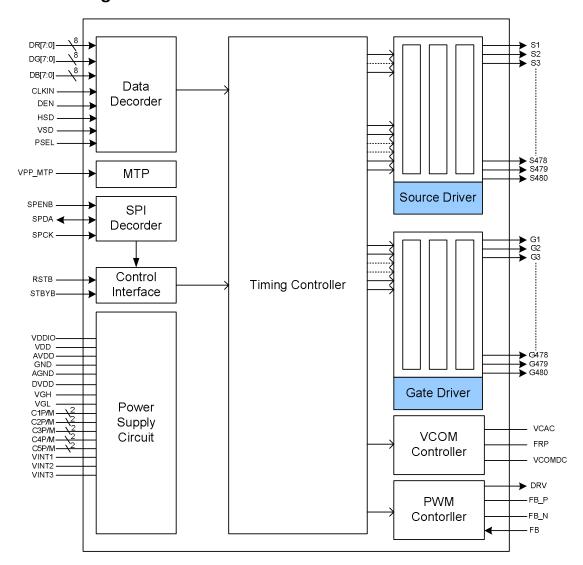

The serial communication interface is also embedded for function settings. This chip can be operated under a wide range of supply voltage. By applying "Double Gate Driver" panel architecture, the number of source output channel is reduced to 480 and the number of gate output channels is increased to 480. For the concern of lower power dissipation, line inversion driving technique is adopted. The dithering technique was also applied for source driver to support 8-bit resolution and the 256-gray scale with small output deviation is designed for the higher color resolution.

#### 2. Features

- Panel resolution (HxV): 960x240
- Double gate driver with 480 sources and 480 gates
- 8-bit resolution, 256 gray scale with dithering (7bits DAC + 1 bit FRC)
- Display control and function selection by 3-wire SPI interface.
- > Support 8-bit RGB, 8-bit Dummy RGB, Parallel RGB, CCIR601 and CCIR656 input.
- > Build-in DC-DC control circuit, charge pump, VCOM with programmable adjustment
- Built-in R-DAC gamma correction
- Line/Column inversion selectable
- Right/Left shift, Up and Down scan function selectable
- Build-In PWM circuit for LED Back-light
- Power for digital circuit (VDD): 2.7V~ 3.6V
- Power for analog circuit (AVDD): VDD/VINT1
- Power for Interface circuit (VDDIO): 1.65V ~ 3.6V

<sup>(\*)</sup> The voltage level of these signals is the same as VDDIO

<sup>(\*\*)</sup> It depends on the register setting. Please see three-wire for detailed description.

<sup>(\*\*\*)</sup> To apply the component or not is base on application.

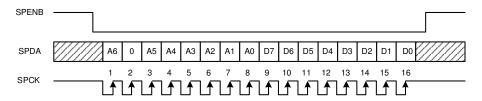

#### 9. 3-wire Serial Interface

#### 3-Wire Serial command format

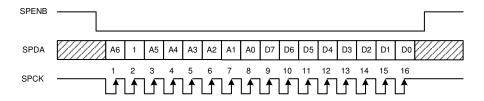

- Each serial command consists of 16 bits of data that is loaded one bit a time at the rising edge of serial clock SPCK. Command loading operation starts from the falling edge of SPENB and is completed at the next rising edge of SPENB.
- > The serial control block is operational after power on reset, but commands are established by the VSD signal. If command is transferred multiple times for the same register, the last command before the VSD signal is valid.
- > If less than 16 bits of SPCK are input while SPENB is low, the transferred data is ignored.
- > If 16 bits or more of SPCK are input while SPENB is low, the first 16 bits of transferred data before the rising edge of SPENB pulse are valid data.
- > Serial block operates with the SPCK clock.
- Serial data can be accepted in the power save modes.

VCOMDC Trim function control register, Write the follow command sequentially to enable the VCOMDC trim function.

Adjust VCDC level:

Set TRMEN[7:0] = 00h and set REGSEL=1(R0Bh=80h)

Write proper VCDC[5:0] value using 3-wire command.

Programming the VCDC value into MTP memory:

Set VPP\_MTP = 7.5V with external power supply for programming operation. (Requirement)

Set TRMEN[7:0] as following sequence : A0h → 5Fh → EEh →00h

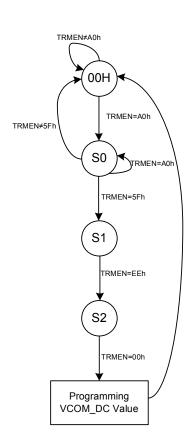

REGSEL will be clear to 0 after the programming procedure.

#### Procedure-1 Set REGSEL = 1, Please make sure VCDCEN=1

# **Procedure-2**Update VCDC vaule

# Procedure-3 VCOMDC trim state please follow Note

# Procedure-4 Handware clear REGSEL=0, check REGSEL =0 by 3-wire read check VCOMDC value

#### Note:

- 1. The Trim Block can be writing for only "3" times
- 2. After finishing TRMEN command do not power off within 1 second.
- 3. Trim command exceed the limitation may cause the VCOMDC output unknown value.
- 4. The CLKIN input frequency should be 26MHz ~ 30MHz.
